

Running 35 parallel instances, each targeting a different database, significantly increases the pressure on your network "funnel."

Since all 35 connections likely share the same transit path, the ORA-12570 is almost certainly occurring because a packet is being dropped or a session is being "reaped" at a common bottleneck.

Here is how to diagnose and fix this for a high-concurrency setup:

#### 1. The Connector Bottleneck (Check Your Sizing)

The Serverless VPC Access connector is not just a routing rule; it is a set of small, hidden VMs (usually e2-micro) that sit between 2 and 10 instances. If your 35 functions are doing a lot of work, you may be hitting the CPU or throughput limit. **Not used anyway**

\* Action: Go to the Cloud Functions console, check the CPU utilization and output metrics for your connector. If CPU is consistently above 50%, increase the Min/Max instances or use a larger machine type (e.g., e2-standard-4).

#### 2. The MTU "Black Hole"

This is the most common cause of ORA-12570 over VPN/Interconnect.

- \* The Conflict: Oracle likes to send large packets (default SDU is often 8KB). However, your VPN tunnel likely has an MTU of 1300-1400 bytes, and GCP VPCs have an MTU of 1460.
- \* The Symptom: Small "handshake" packets work fine (the connection opens), but as soon as a query returns a large result set, the packet exceeds the MTU and is dropped.
- \* The Fix: Force Oracle to use smaller packets by reducing the SDU (Session Data Unit) in your connection string:

```
(DESCRIPTION=(SDU=1400)ADDRESS=(PROTOCOL=TCP)(HOST=your_host)(PORT=1521))(CONNECT_DATA=(SERVICE_NAME=your_svc))
```

#### 3. Switch to Direct VPC Egress (Recommended)

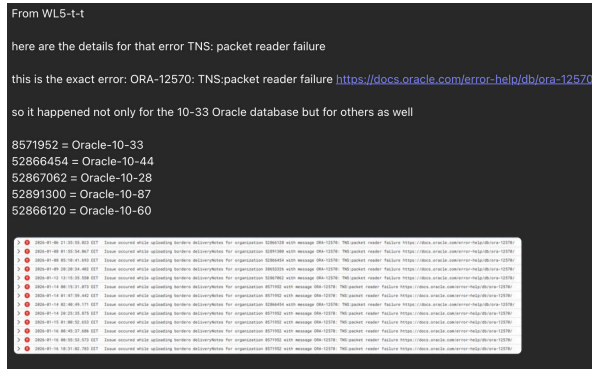

If you are using Cloud Functions (2nd Gen), you can bypass the "Connector" entirely by using Direct VPC Egress.

- \* Why: Direct Egress is more performant and doesn't rely on the fixed-size proxy VMs of the VPC Connector. It handles high concurrency (like 35+ parallel bursts) much more gracefully.
- \* Action: In your Cloud Function configuration, under the Network tab, switch the Egress setting from "VPC Connector" to "Direct VPC Egress."

#### 4. Firewall Session Limits

On-premise firewalls often have "Maximum Concurrent Sessions" or "Embryonic Connection" limits per source IP.

- \* Because all 35 functions are coming from the same internal IP range of your VPC Connector, the firewall might see this as a "SYN flood" or simply exceed the allowed connections from a single host.
- \* Action: Ask your Network/Security team if they see "Connection Reset" or "TCP Intercept" logs for the VPC Connector's IP range during your 35-instance burst.

|   |                             |                                                                                                                                                                                                                                                  |
