

Management Summary: WL4 Deployment Strategy

Hi [Recipient],

Decision: We will deploy two instances of all New Dispo components in the WL4 TEST environment instead of one.

Reason: WL4 is missing the DEV environment which should have been there from the beginning.

The problem:

- WL1, WL2, WL3: each has DEV, TEST, and PROD
- WL4: only has TEST and PROD (DEV missing)
- We need an environment for internal testing before exposing to customers

The solution:

Deploy two instances in WL4 TEST:

1. Instance 1: internal testing (DEV-equivalent)
2. Instance 2: customer-facing testing (TEST-proper)

Why this approach:

- Bureaucratic overhead of provisioning a new DEV environment > accepting this technical debt
- Unblocks development immediately
- Maintains separation between internal and customer testing
- Reversible if WL4 DEV gets provisioned later

Components affected:

- New Dispo Backend and Frontend
- New Dispo Database
- KeyCloak
- Pickup Filter Function (CloudFn)

Costs:

Approx. 2x infrastructure costs in TEST environment (2x Cloud Run, 2x databases, etc.).

This is an anti-pattern and technical debt, but pragmatic given the alternative.

Full documentation: ADR-005

Thanks

Matthias
